Introduction Inception Hindi Audio Track 12 is uploaded by bobbyfoster on this auspicious day. It contains eight minutes and forty three seconds long of the first scene of Inception so as to assist you know and understand the first scene. The first scene starts with a dream sequence shot by Cobb after he falls asleep during a job interview for his newest project which is inception.The word inception means to dip into or enter into something, it can also refer to the process whereby an idea becomes manifest in visible reality, or it refers to knowledge that has been created or generated from itself without previous precedent or cause. Today is December 12th, year 2010. I have just uploaded the first scene of the film Inception, this scene was shot before we finished the movie and was shown to selected critics and movie experts.The scene is a dream sequence and there is a unique character in this dream who is like a god, here sometimes we say that it's an inception stage From:INSIGHT: A BRIEF HISTORY OF THE CONCEPT OF DREAMS [/cs_column][cs_text class="cs-text-center"] In 1953, two ideas—a mind like an empty book and a brain like a machine—were put together by Roger Sperry at Cal Tech. He was a brilliant scientist and PhD in neurophysiology, his son Raymond came along. He was a bright boy who loved anything to do with computers so he became an expert in video coding and decoding which is exactly what his father was interested in. And so the two of them started working on a fusion project which involved using information from one's brain to be translated into computer code. This is a kind of modern-day telepathy. It was called Brain-Computer Interface, BCI for short. In the film Inception, Cobb is a very experienced extractor and he can enter into someone's unconscious mind and pluck out a person's deepest secrets once the person has been put to sleep by a drug called "Nepo" or "Nemo". Cobb goes on to work for Saito after doing what he does best as an extractor, Saito wants Cobb to try something new so instead of extracting secrets from individuals, Cobb is asked to plant an idea in some specific individuals as they sleep. He will do this by dreaming and entering someone's dreams. The idea will be implanted whenever the person sleeps. The very first stone thrown at this concept was in 1965, when Dr. Benjamin Libet conducted experiments involving an EEG machine and a subject who was asked to press a button for the recording of the electrical activity in his brain. This is how it occurred: The subject would go into a strange place and he would be hooked up to special electrodes that were placed around his head and scalp. Then he would watch videos, after which he would go through a set of tests on computer equipment.
